What's a Prototype?

A disposable artifact that can be created quickly and easily in order to answer a specific question about your project.

What's a Prototype?

A disposable artifact that can be created quickly and easily in order to answer a specific question about your project.

Disposable

“If you don’t have the discipline to throw away the prototype, you’re defeating the very purpose of prototyping.”

– Jeff Atwood

Artifact

Paper

Whiteboard

Wireframes

Interactive

Proof of Concept

Quickly and Easily

Familiar Tools

Small Team

Short Timeframe

Ask Specific Questions

**Not a hacky version of final product.
Identify a specific question.**

Bad Question

“What language should we use?”

Better Question

“Does language X have the performance, ease of use and interoperability for this project?”

Answering the Question

Narrow to Python, Ruby, C++

Build quick (2-day) performance test

Report back

Bad Question

“How is the user interface going to work?”

Better Question

**“Would the client be happy to use a
command line interface?”**

Answering the Question

**Write a shell script that gives fake
return values**

**Sit down with the client and/or users
and see if it meets needs**

Client Understanding

Your Understanding

“Canyons”

Client: MUVES

**Objective: Develop a game to help
automate stroke rehabilitation**

“Canyons”

“Canyons”

“Canyons”

C#

Ogre Game Engine
Mogre C# Bindings
3D Studio Max

Prototyping

Good: Built simple version of game to see if C# and Ogre game engine suitable.

Prototyping

Bad: Didn't throw away prototype.

Prototyping

**Bad: Didn't pay enough attention to
what the prototype told us.**

Prototyping

Bad: Didn't stick to specific prototype goal.

Prototyping

Could have: Prototyped at least one other game engine.

Prototyping

**Could have: Prototyped completely
different style of game.**

Prototyping

Should have: Used the prototypes to increase communication with client.

“Family Fun”

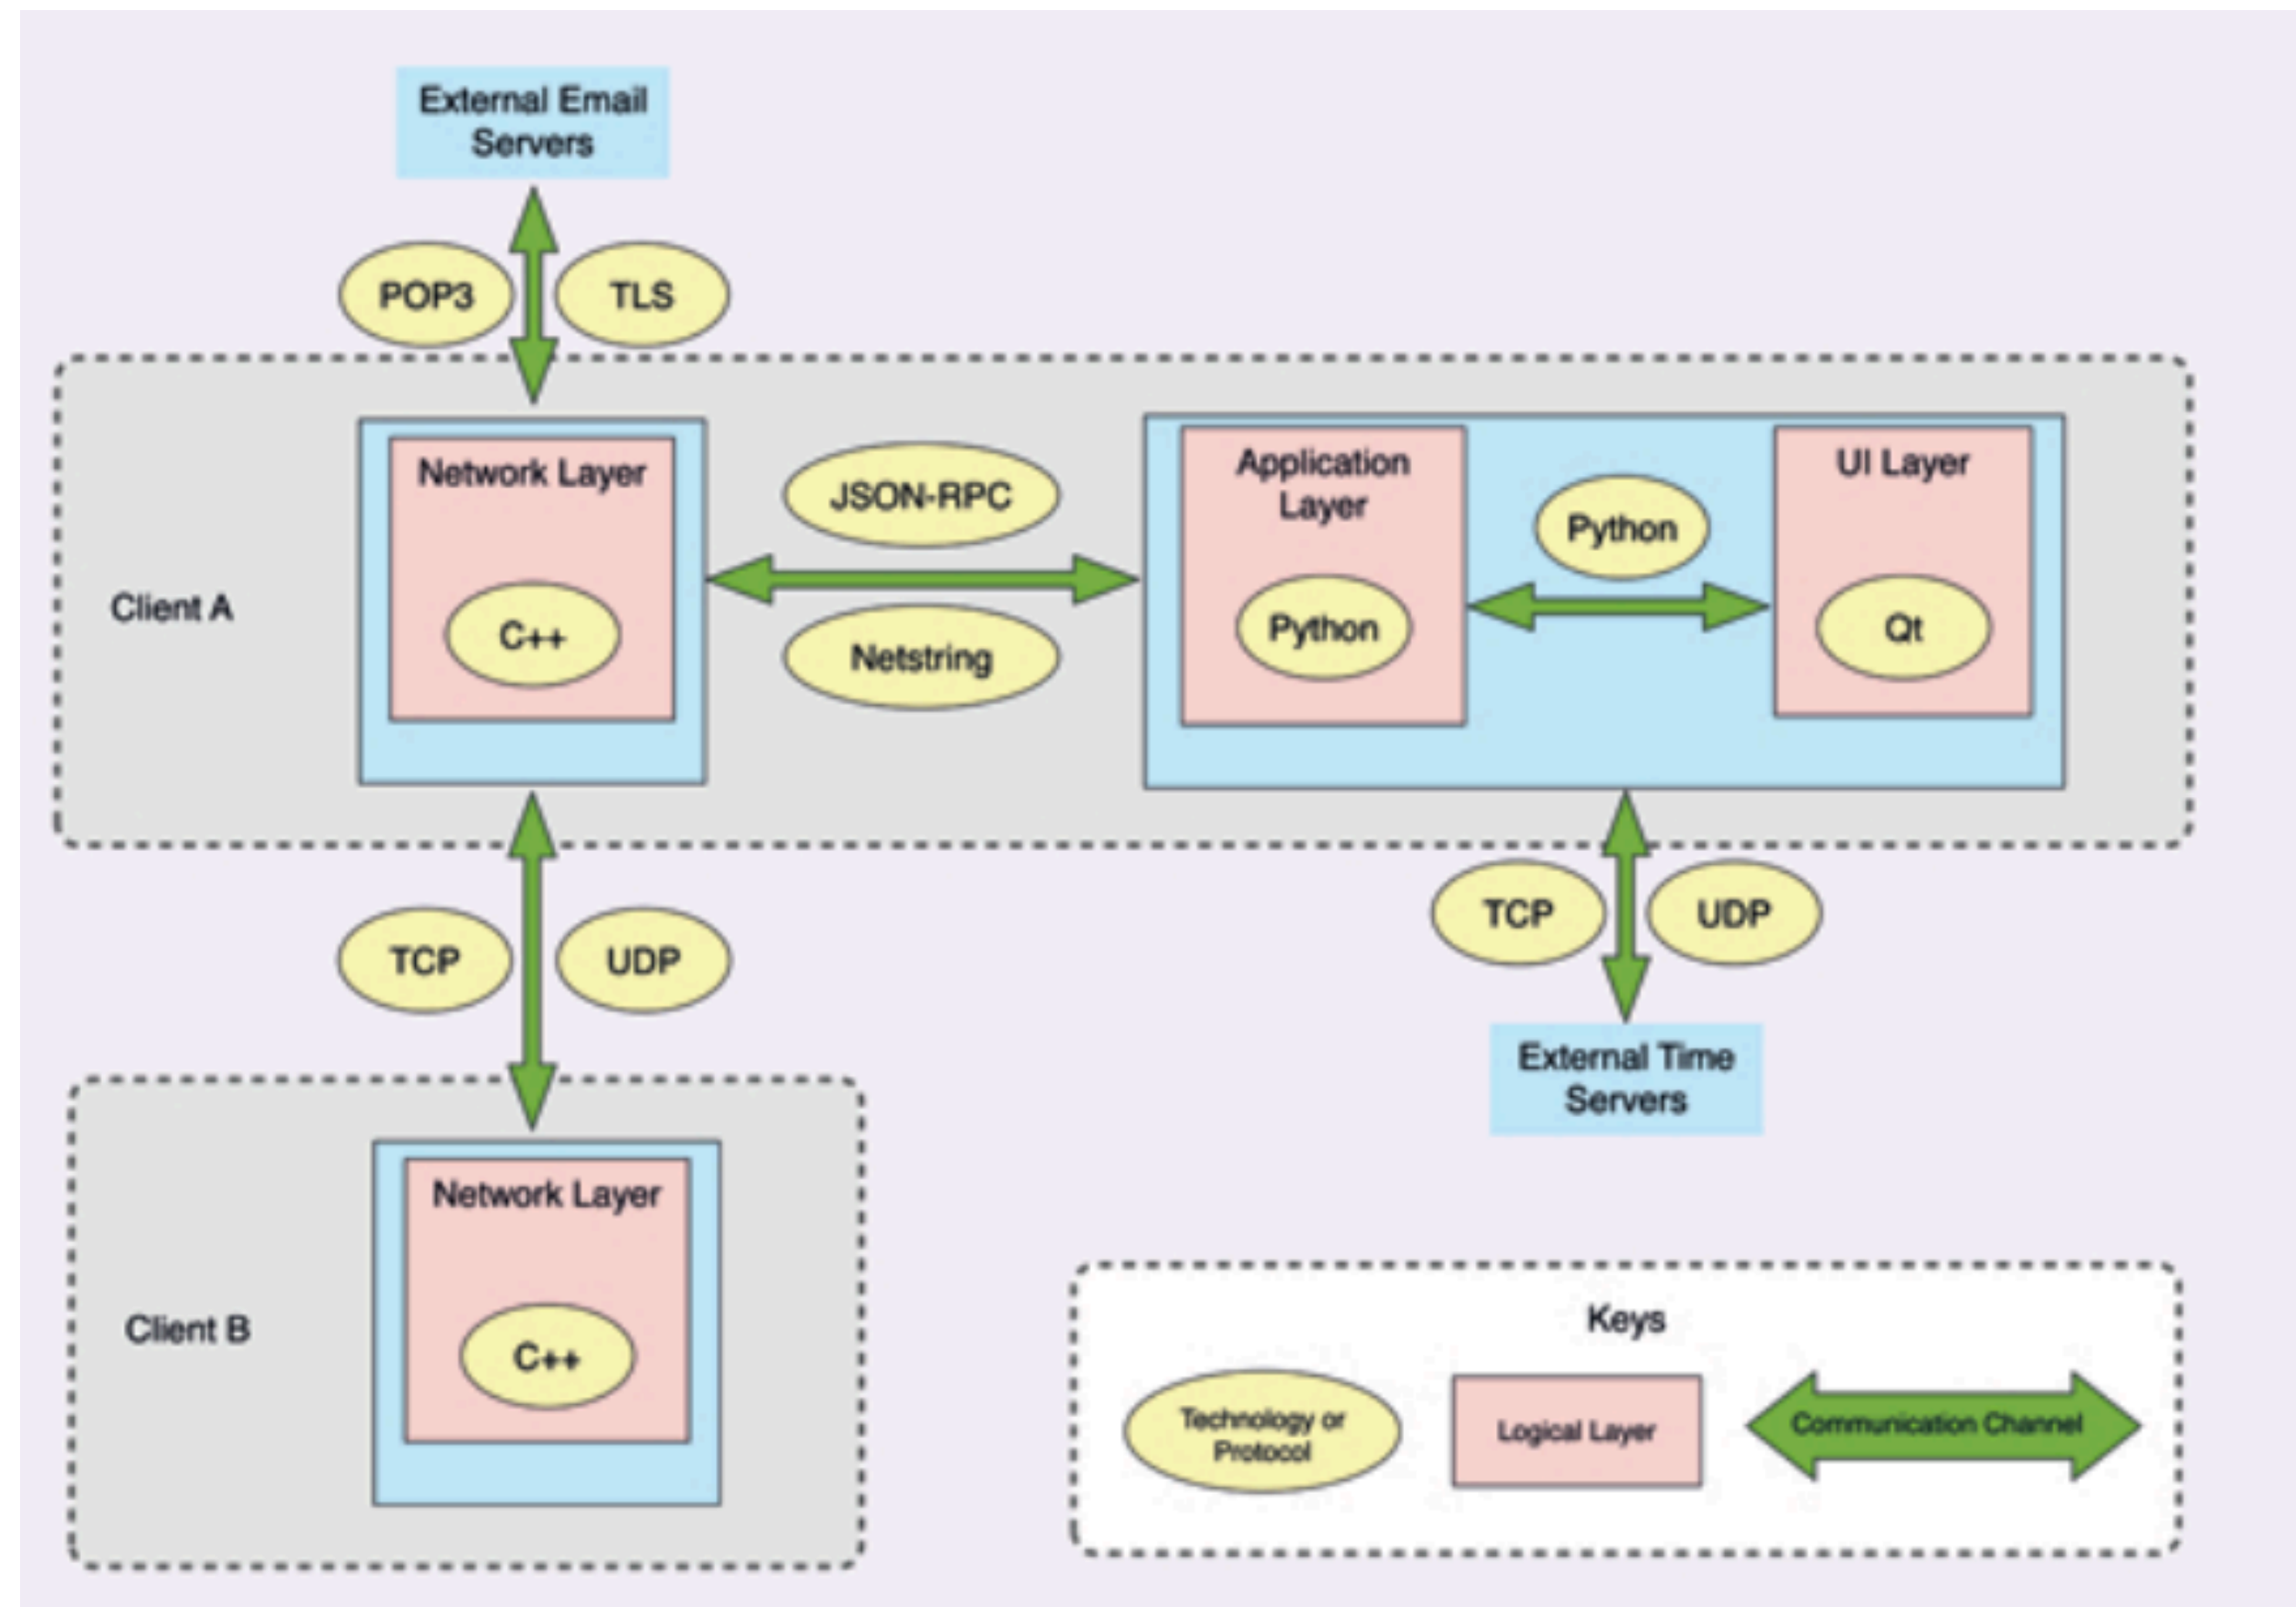

Client: UniMelb Researchers

**Objective: “Interactive, synchronised,
decentralised, distributed
communication system.”**

“Family Fun”

“Family Fun”

“Family Fun”

Large number of moving parts:

- Interactive graphical frontend
 - Email Parsing****
- Synchronisation Code
 - VoIP****
- P2P Network Layer**

“Family Fun”

Python/Qt (front-end)

C++ (network layer)

VoIP library

Prototyping

Good: Created two prototypes to determine which graphics framework to use.

Prototyping

Good: Threw these prototypes away!

Prototyping

Good: Didn't spend lots of time or development effort.

Prototyping

Good: Prototyped the UI with pen and paper for the client.

Prototyping

(Really) Bad: Could have cut project size in half with a prototype.

Prototyping

(Really) Bad: Could have cut project size in half with a prototype.

Prototyping

Bad: UI Prototype wasn't interactive and didn't explore other options.

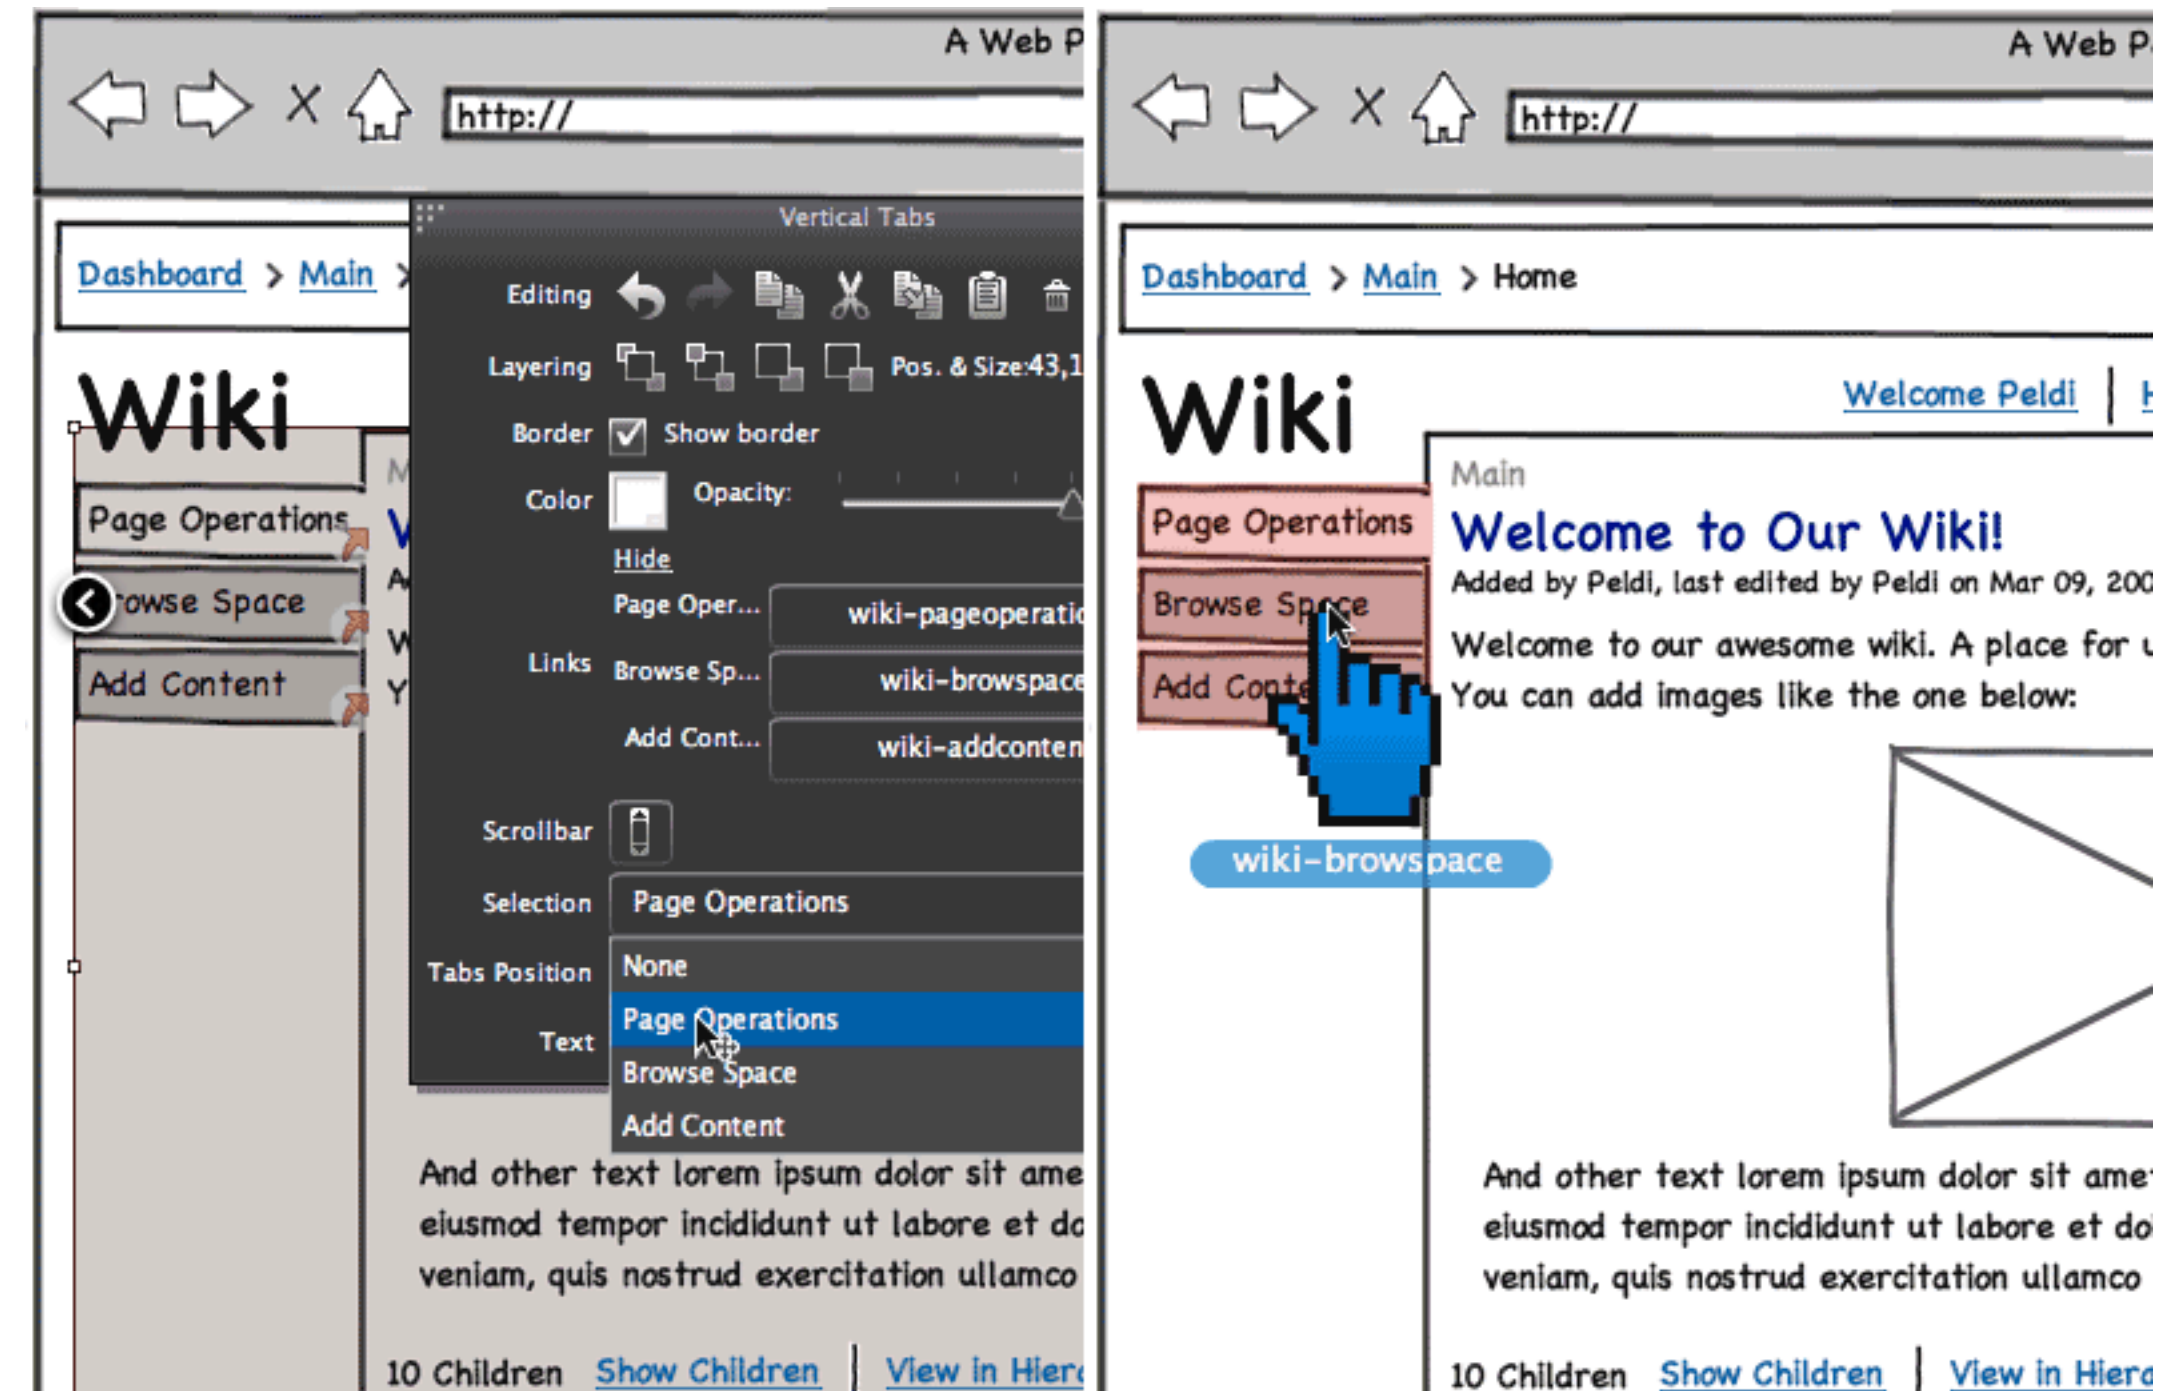

Prototyping Tools
